Do Now: CO<sub>2</sub> = carbon <u>di</u>oxide, a binary molecular (covalent) compound.

## Aim: How do we name binary molecular (covalent) compounds?

### I. <u>Using Prefixes</u>

| number atoms | prefix |
|--------------|--------|
| 1            | mono   |
| 2            | di     |
| 3            | tri    |
| 4            | tetra  |
| 5            | penta  |
| 6            | hexa   |
| 7            | hepta  |
| 8            | octa   |
| 9            | nona   |
| 10           | deca   |

#### Given formula, write name

CO monocarbon monoxide

a) Write a prefix for each element, but don't use mono for the 1<sup>st</sup> element.

b) Change the ending of the 2<sup>nd</sup> element to **ide**.

CCl<sub>4</sub> carbon tetrachloride

P<sub>2</sub>O<sub>5</sub> diphosphorus pentaoxide

c) Usually, vowels in the prefixes are dropped when they precede another vowel.

H<sub>2</sub>O dihydrogen monoxide (DHMO aka water)

N<sub>2</sub>O<sub>4</sub> dinitrogen tetraoxide

**Note:** for molecular compounds, **don't reduce** the subscripts unless told to do so. When reduced, the molecular formula becomes an **empirical formula**.

| <b>Molecular Formula</b>      |                             |  |  |
|-------------------------------|-----------------------------|--|--|
| the actual # atoms            | the simplest ratio of atoms |  |  |
| N <sub>2</sub> O <sub>4</sub> | NO <sub>2</sub>             |  |  |

**Go to Handout: Naming Molecular Compounds** 

# Naming Molecular Compounds

Name the following covalent compounds.

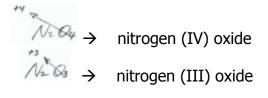

| 1. CO <sub>2</sub>                | Carbon dioxide           |         |
|-----------------------------------|--------------------------|---------|
| 2. CO                             | Carbon Manoxide          |         |
| 3. SO <sub>2</sub>                | Sulfur dioxide           |         |
| 4. SO <sub>3</sub>                | sulfue trioxide          |         |
| 5. N <sub>2</sub> O               | dinitrogen monoxide      |         |
| 6. NO                             | nitragen monoxide        |         |
| 7. N <sub>2</sub> O <sub>3</sub>  | dinitrogen trioxide      |         |
| 8. NO <sub>2</sub>                | nitrogen dioxide         |         |
| 9. N <sub>2</sub> O <sub>4</sub>  | dinitrogen tetra exide   | e .     |
| 10. N <sub>2</sub> O <sub>5</sub> | dinitrogen pentaoxide    |         |
| 11. PCI <sub>3</sub>              | phosphorus trick loride  |         |
| 12. PCI <sub>5</sub>              | phosphorus pentachloride |         |
| 13. NH <sub>3</sub>               | nitrogen trihydride aka  | ammonia |
| 14. SCI <sub>6</sub>              | sulfue hexachloride      |         |
| 15. P <sub>2</sub> O <sub>5</sub> | diphosphorus pentaoxide  |         |
| 16. CCI <sub>4</sub>              | Carbon tetrachloride     |         |
| 17. SiO <sub>2</sub>              | silicon dioxide          |         |
| 18. CS <sub>2</sub>               | carbon disulfide         |         |
| 19. OF <sub>2</sub>               | Oxygen diFluoride        |         |
| 20. PBr <sub>3</sub>              | phosphorus tribromide    |         |

#### **EXTRA CREDIT**

II. Using Roman Numerals (Stock System)

The Roman numeral indicates the oxidation state of the first element (+).

Given formula, write name:

a harder problem; can't "cross-criss:"

$$rac{+y}{CO_2} 
ightharpoonup$$
 Carbon (IV) oxide

Given name, write formula:

Phosphorus (V) chloride 
$$\rightarrow$$
 PCIs

III. Other systems of nomenclature exist; just know the Stock System for ionic compounds and prefixes for molecular compounds.
