Hydrogen reacts with oxygen to form water.
$\mathrm{H}_{2}+\mathrm{O}_{2} \rightarrow \mathrm{H}_{2} \mathrm{O}$
What's wrong? It doesn't "balance."

## Aim: How do we balance chemical equations?

## Hz

 $+$ $O_{2}$

1) Don't change the subscripts.
2) Don't add/subtract substances.
3) Just multiply the substances in the equation by changing the coefficients.

$$
\mathbf{2} \mathrm{H}_{2}+\mathbf{1} \mathrm{O}_{2} \quad \rightarrow \quad \mathbf{2} \mathrm{H}_{2} \mathrm{O}
$$

The " 1 " in front of $\mathrm{O}_{2}$ is assumed.
If you're having a problem, picture this:

Let' s do an atom count.
Check: coefficient $\mathbf{x}$ subscript $=$ \# atoms

A chemical equation must balance to satisfy the Law of Conservation which states that matter and energy cannot be created nor destroyed. Therefore, the total number of atoms on both sides of the equation must be equal.

## Let's do some more problems. Go to Balancing Act 1.

RCHEM 2/Chille
BALANCING ACT 1
Balance the following chemical equations.

1) $\mathrm{H}_{2}+\mathrm{F}_{2} \rightarrow 2 \mathrm{HF}$

Sum of Coff Ran Type
(4)

9) $\mathfrak{R}^{4} \mathrm{Al}+3 \mathrm{O}_{2} \cdots 2 \mathrm{Al}_{2} \mathrm{O}_{3}$

Example of a Combustion Reaction

42) IF Fractional coefficient, Double everything.
